

Valorant Masters Teams Analysis (Stats & Earning Rates)

The purpose of this visualization was an examination and analysis of two datasets. One from the 2021 Valorant Master Tournament held in Berlin, Germany and their players' stats, and a second containing estimated earnings and placements of individual players. Data is to be later used in a Multiple Linear Regression Model to predict unknown earning estimations of other Valorant Masters Participants. Links to both datasets are image linked at the top right of the dashboard.

Try clicking on any of the team or player names! Each contain the earnings broken down to player level, and to the left you can view their stats individually

Datasets

Placings By Team

Summary

- For our datasets, thorough cross correlation, we found that the Rank, KDA(Kill/Death/Assist Ratio), Gold Placemens, and S-Tier placements had the most impact when predicting earning estimations (Scatterplots Seen Above).

Note:

Team Sentinels and their player Shazam was found to have the highest earnings across our dataset of Teams. Minimum streaming requirements were taken into account for teams and removed as data. Through only competition and placements their earnings remained the highest.

-An outlier for this Data, TenZ was found to have the highest stats across the database, but only rank third in earnings
